

Figure S2. Estimated marginal means of panicle metrics of nine coastal lowland self-pollinated lines (CLS) and commercial cv Regalona grown in a field experiment under full irrigation (FI) and reduced irrigation (RI); (a) Panicle length; (b) Panicle maximum width. The purple bar corresponds to the 95% confidence interval of the estimate (black dot), whereas the degree to which red arrows overlap reflects the significance of the comparison of two estimates.
