The *p*-value indicates the deviation from the entire population in the characterization of the A-I, A-A, and I-I groups with the respective characterizing variables. Lighter shades of grey signify a decrease, while darker shades denote an increase from baseline to 12 months of follow-up. *p* < 0.05 is marked in bold. Abbreviations: UWF: ultra-wide-field pseudocolor retinography; BL: baseline; m: months.
