

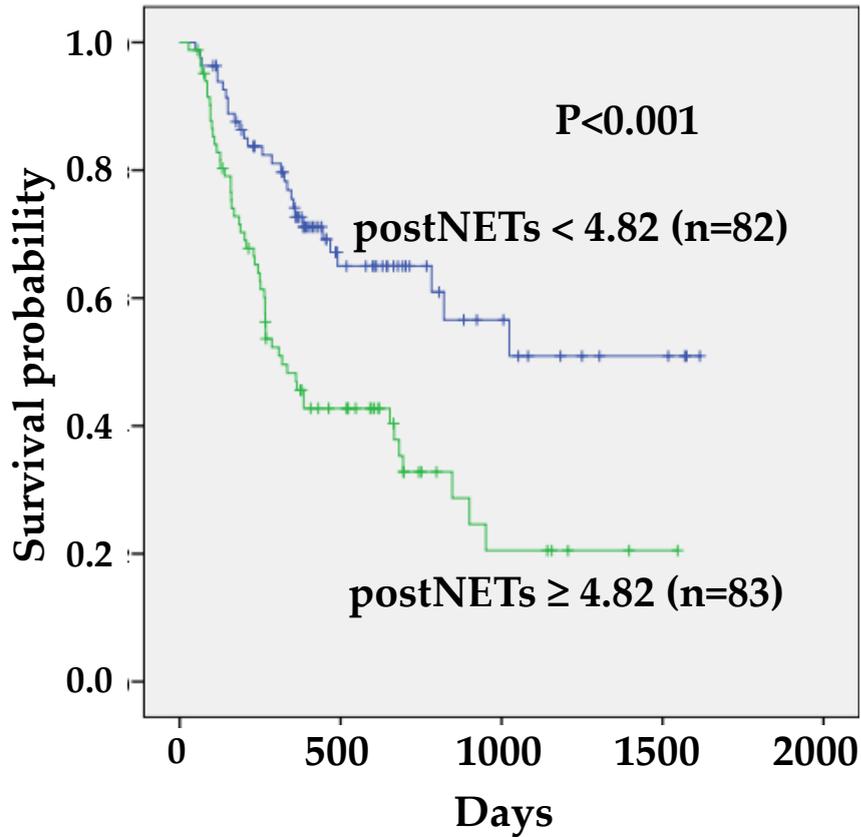

Figure S1

A

OS

B

PFS

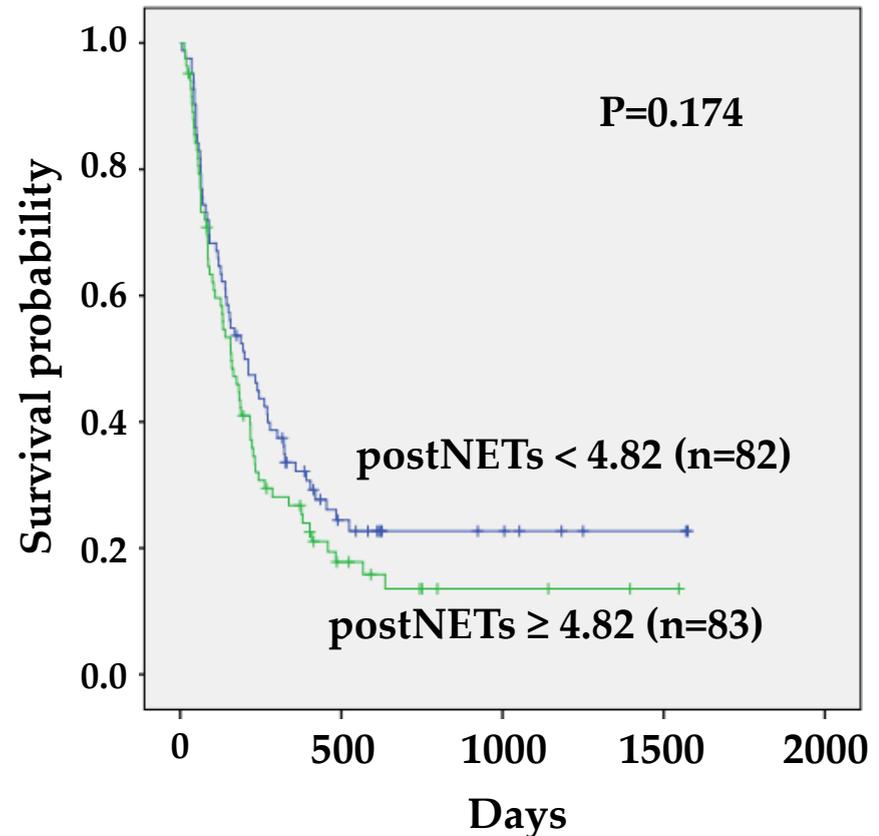

Figure S1. Association between posttreatment NET levels and OS or PFS. Kaplan-Meier plot of OS (A) or PFS (B) in the high- and low-NET groups. The ICI-treated patients were divided into two groups based on the median value of postNETs (4.82 ng/mL). Differences were assessed statistically using the log-rank test.

Figure S2

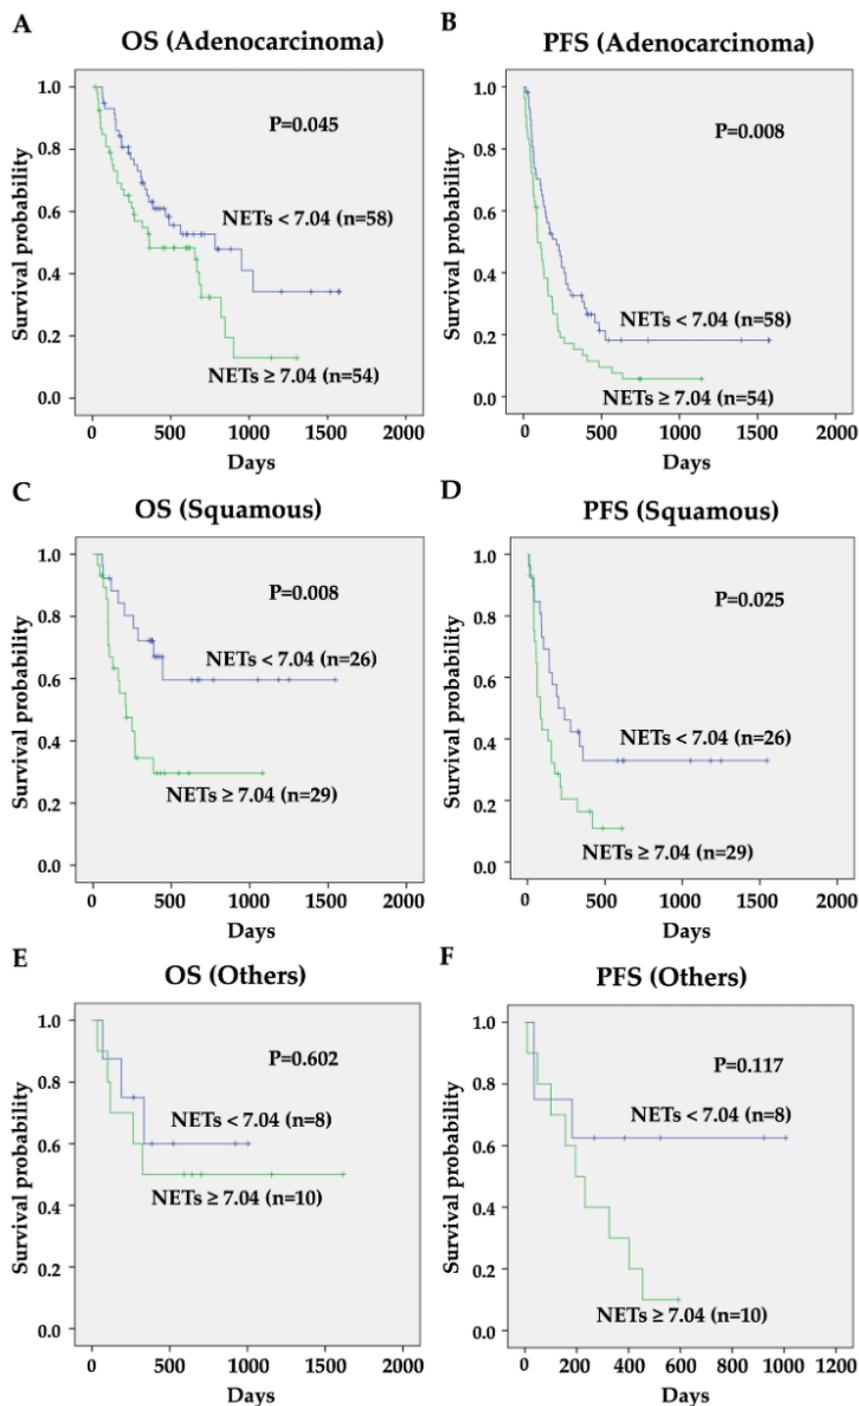

Figure S2. Association between pretreatment NET levels and OS or PFS in the subgroups based on histopathological types. Kaplan-Meier plot of OS or PFS in the high- and low-NET groups in the subgroup of adenocarcinoma (A, B), squamous cell carcinoma (C, D), and others (E,F). The ICI-treated patients were divided into two groups based on the median value of NETs (7.04 ng/mL). Differences were assessed statistically using the log-rank test.

Figure S3

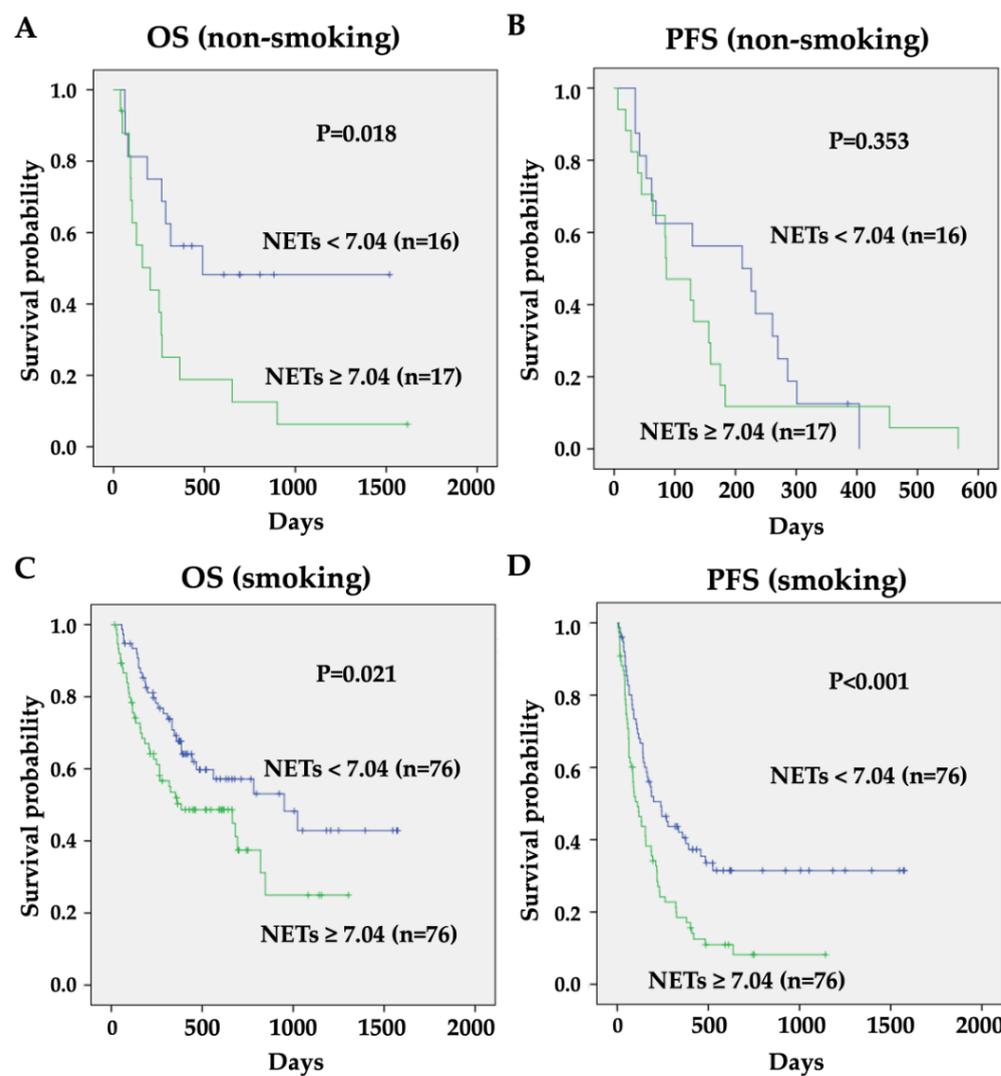

Figure S3. Association between pretreatment NET levels and OS or PFS in the subgroups based on smoking history. Kaplan-Meier plot of OS or PFS in the high- and low-NET groups in the subgroup without (A, B) and with (C, D) smoking history. The ICI-treated patients were divided into two groups based on the median value of NETs (7.04 ng/mL). Differences were assessed statistically using the log-rank test.
