LPC is lysophosphatidylcholine, and LPE is lysophosphatidylethanolamine. ND is not detected. NA is not available. Mean values are the average of three independent lines of each genotype. STD are shown in the brackets.

Supplementary Figure S1. Comparison of chain length distribution of debranched starch of *OsFAD2-1* RNAi backcross lines. Starches from three independent line of each genotype were used for the analysis with two replicates for each sample. Error bars indicate the standard deviation. Asterisks indicate differences at the statistical level, $P < 0.5$. A, CLD profiles of *FAD2^{DR}* and *FAD2^{WT}* lines. B, Differences in the CLD profiles of amylopectin between *FAD2^{DR}* and *FAD2^{WT}* lines. C, Comparison of CLD proportions in short chains ($\sum DP \leq 10$), intermediate chains ($\sum DP \leq 24$) and their ratio ($R_{CL10/24}$).
