Supplementary Materials

Figure S1. Quantification heatmap of significant variables of the volatilome (ANOVA $P < 0.05$).

Figure S2. Texture analysis.

Figure S3. Significance of Spearman rank correlations.

Table S1. pH measurements.

Table S2. MANOVA categorical descriptors for the volatilome, categorized for the type of matrix.

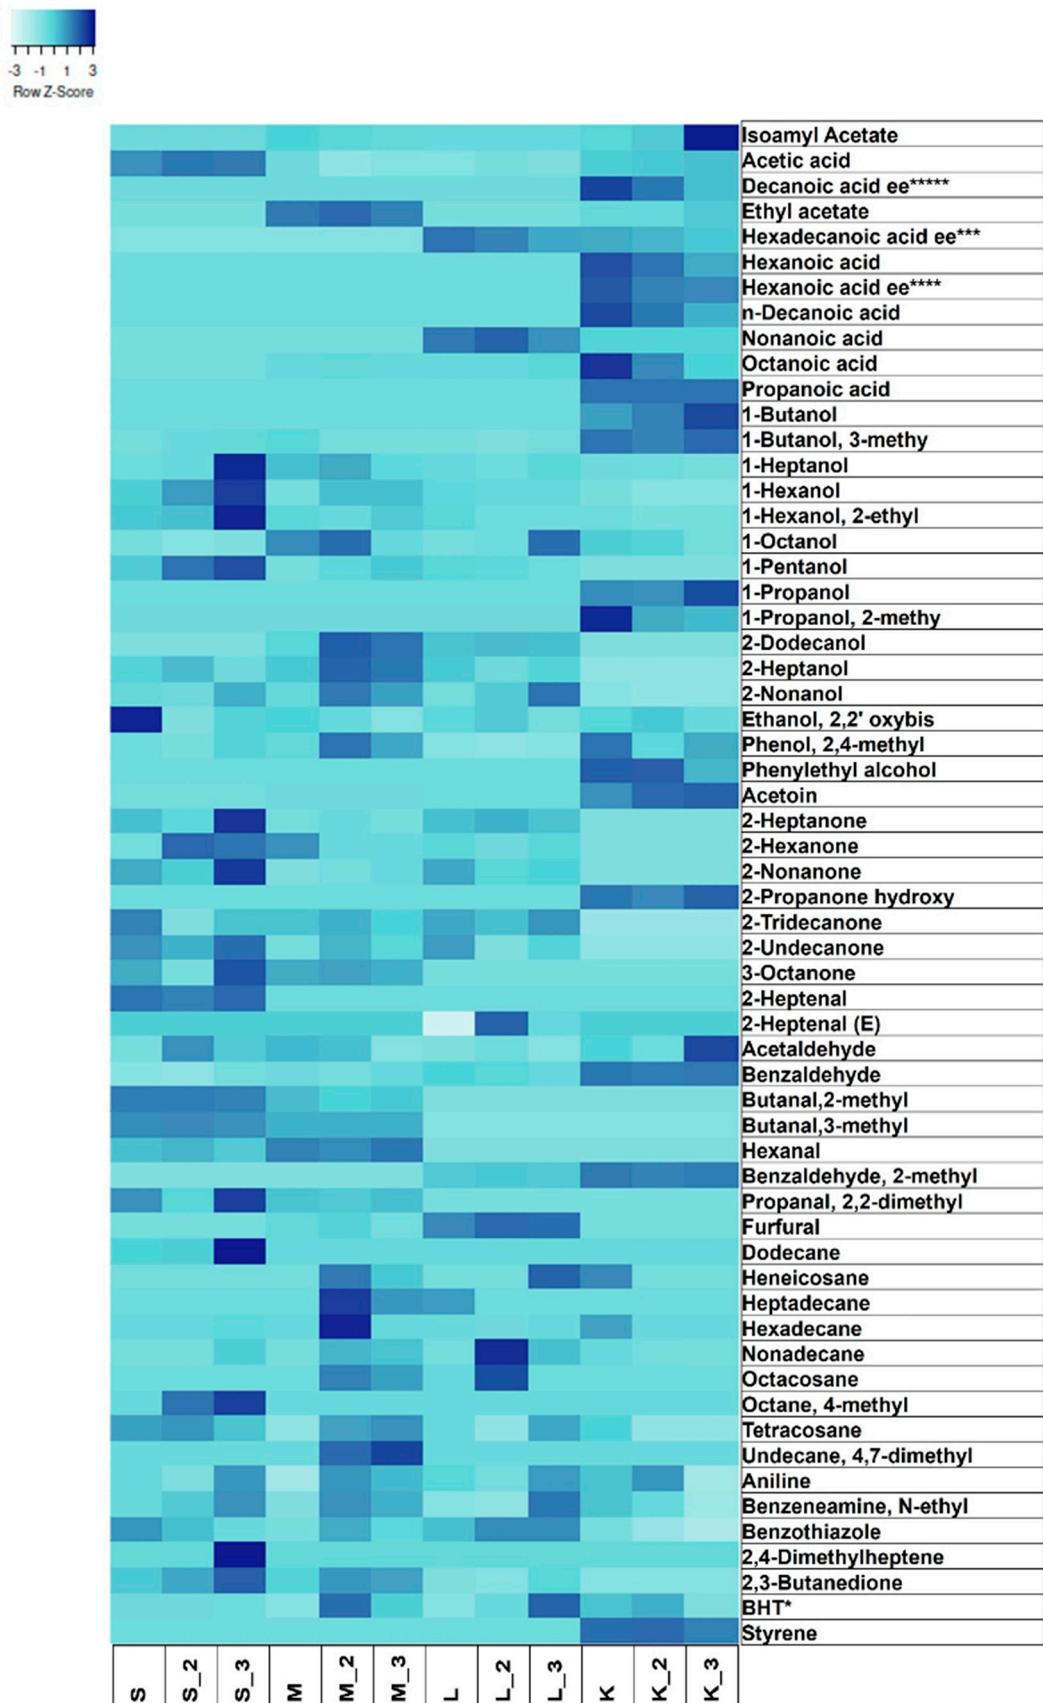

Figure S1. Quantification heatmap of significant variables of the volatilome (ANOVA $P < 0.05$).

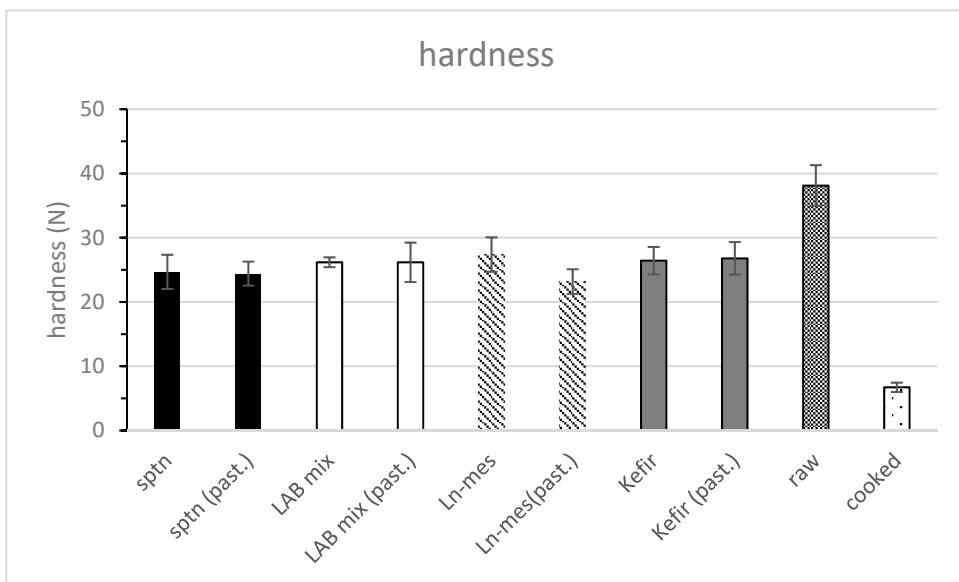

Figure S2: Texture results of beetroot samples fermented, fermented and pasteurized (past), compared to the raw and the cooked samples. Amounts reported are the average value of the replicates, the error bars representing the standard deviation “sptn”: spontaneous fermentation; “LAB mix”: fermentation after inoculum with mixed lactic acid bacteria starter culture; “Ln-mes”: fermentation after inoculum with single-strain *Ln. mesenteroides* starter culture; “Kefir”: fermentation after inoculum of LAB and yeasts water kefir starter. For this samples measurement was taken on five samples for each of the three fermentation replicates. For raw and cooked beetroot measurement was taken on five samples of one product.
