Figure S1. Analysis of microbial genera in HBAs and LBAs brewing. The relative abundance of the predominant bacterial (A) and fungal (B) genera. Principal component analysis (PCA) of bacterial (C) and fungal (D) communities. Visualization of the differences in the relative abundance of bacterial (E) and fungal (F) genera between HBAs and LBAs. Microbial genera with significant differences between HBAs and LBAs were determined using a Welch's t-test, and the Benjamini-Hochberg procedure was used to control the false-discovery rate due to multiple testing. Corrected P values are shown at right.
