Table S2. The actual concentrations of PCNB during exposure process (mg/L). The concentration of PCNB exposure were relatively constant and maintained within the range of $\pm 10\%$ of the nominal concentration during the exposure process.

Concentration (mg/L)	6 hpf	24 hpf
DMSO	ND	ND
0.25	0.2482 \pm 0.0002	0.2483 \pm 0.0005
0.5	0.5059 \pm 0.0002	0.5059 \pm 0.0002
0.75	0.7633 \pm 0.0002	0.7633 \pm 0.0001

ND: Not detected, <LOD. The data were expressed as mean \pm standard deviation (SD). n=3.

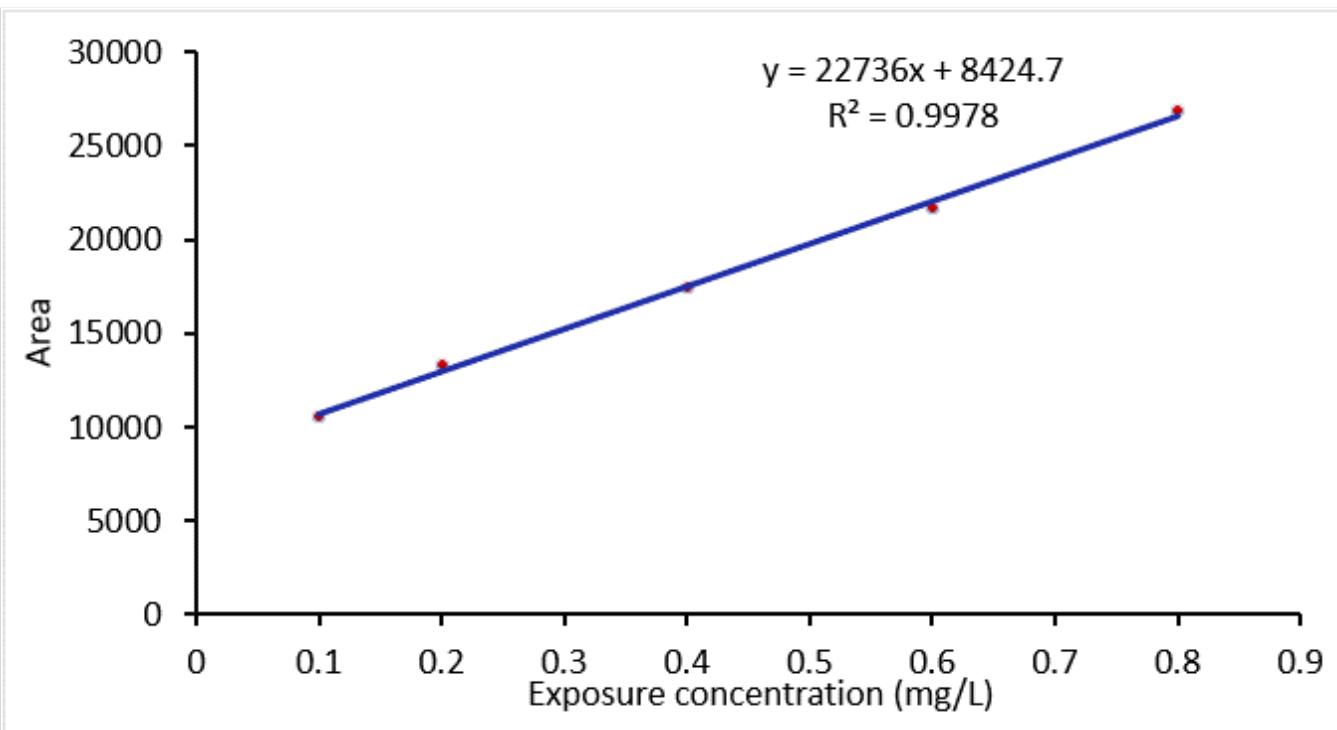

Figure S1. The results of actual concentration determination. The retention time was about 3.85 min. Calibration curves were obtained prior to each day of analysis and linearity was confirmed from 0.1 mg/L to 0.8 mg/L ($R^2 = 0.9978$). All measurements were performed in triplicate. PCNB concentration determination. The linear regressions ($R^2 > 0.99$) generated from a 5-point calibration standard.
