Chapter S1. Boxplot method

Scatterbox with boxplots were constructed for each of three datasets (PE pellets, PP pellets and Fibers) separately, to get insight into statistical anomalies and distribution.

In PE pellets dataset there are several anomalies (Figure S1). Zn distribution in PE pellet dataset is not very regular, despite that all samples except PE pellets with 5 mg/L HA present in the seawater solution, sampled after 21 days, are in the range which does not present anomalies. Mentioned sample is outlier (anomaly of lower degree). Cd, Pb and Cu does not show any anomaly in PE pellet dataset and show rather normal distribution, especially Pb, which distribution is like an example of statistical normal distribution. Ni shows two anomalous values. One of them (PE pellets with 5 mg/L HA present in the seawater solution, sampled after 21 days) is extreme (anomaly of higher degree), while the other anomalous value (PE pellets with 0.1 mg/L HA present in the seawater solution, sampled after 3 hours) is an outlier. The extreme value of Ni is in the same sample in which is outlier for Zn. Co in PE pellet dataset has several negative outliers, but they will not be discussed due to the fact that they are values equal to 0, i.e. values under the detection limit or which were not analyzed, so they can be ignored. Co also has one positive extreme value in the sample PE pellets with 1 mg/L HA present in the seawater solution, sampled after 21 days.

All samples from the PP pellet group do not show any anomalous values and all elements within this dataset have normal distribution, which is for majority of elements perfectly regular (Figure S2).

In Fibers dataset only Zn and Ni show outliers (anomalies of lower degree) (Figure S3). No other element shows any anomaly. Zn shows 2 outliers, and these samples are fibers with 1 mg/L HA present in the seawater solution, sampled after 24 hours and fibers with 1 mg/L HA present in the seawater solution, sampled after 2 days. Ni shows 1 outlier in sample fibers with 5 mg/L HA present in the seawater solution, sampled after 3 hours.

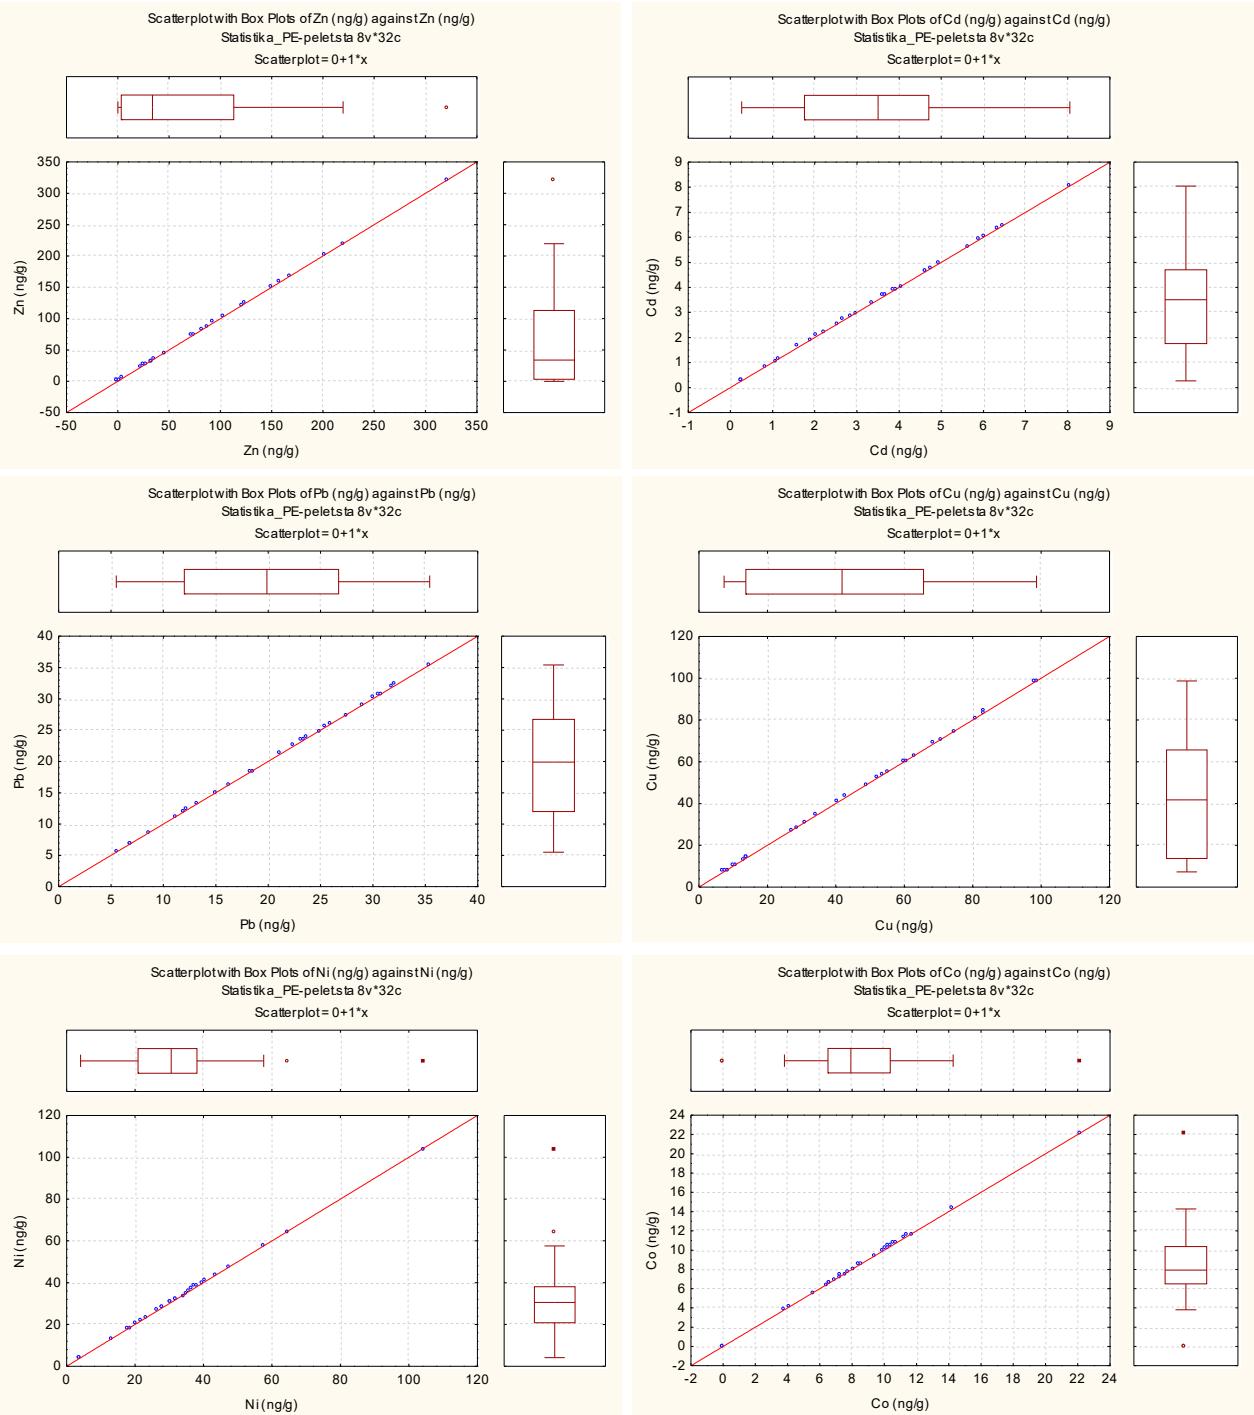

Figure S1. Scatterbox with boxplot for PE pellets samples.

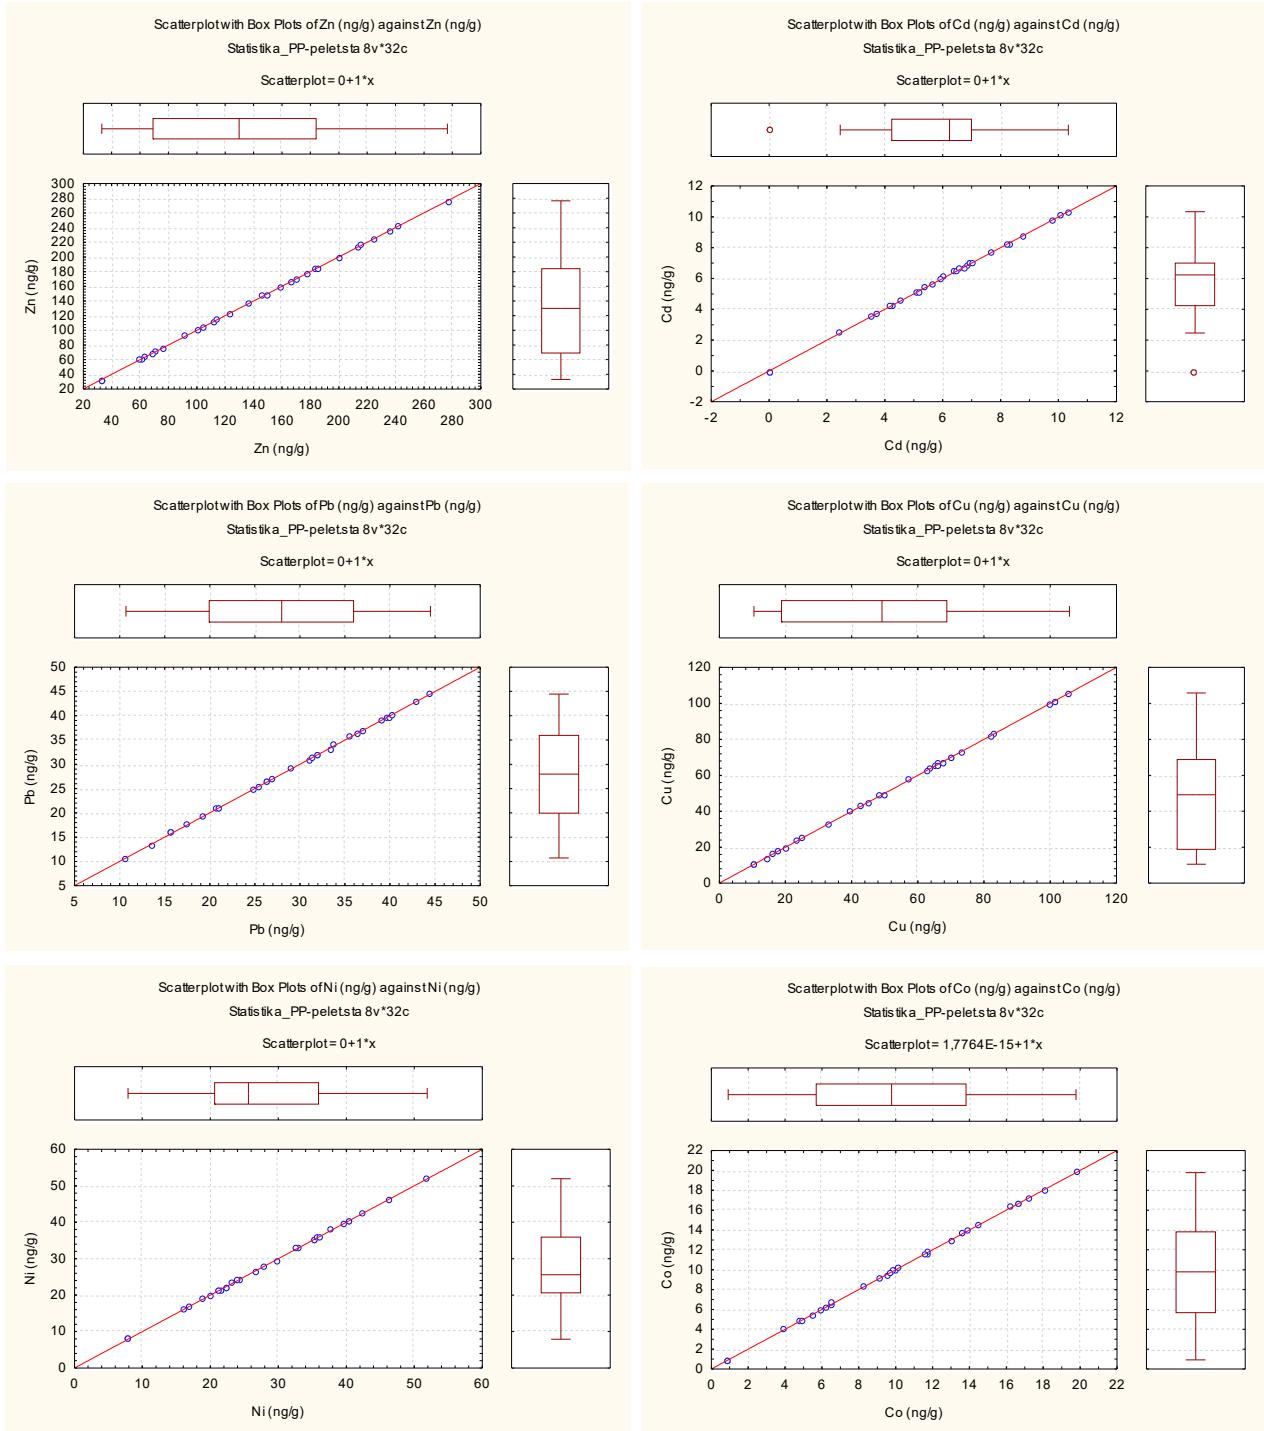

Figure S2. Scatterbox with boxplot for PP pellets samples.

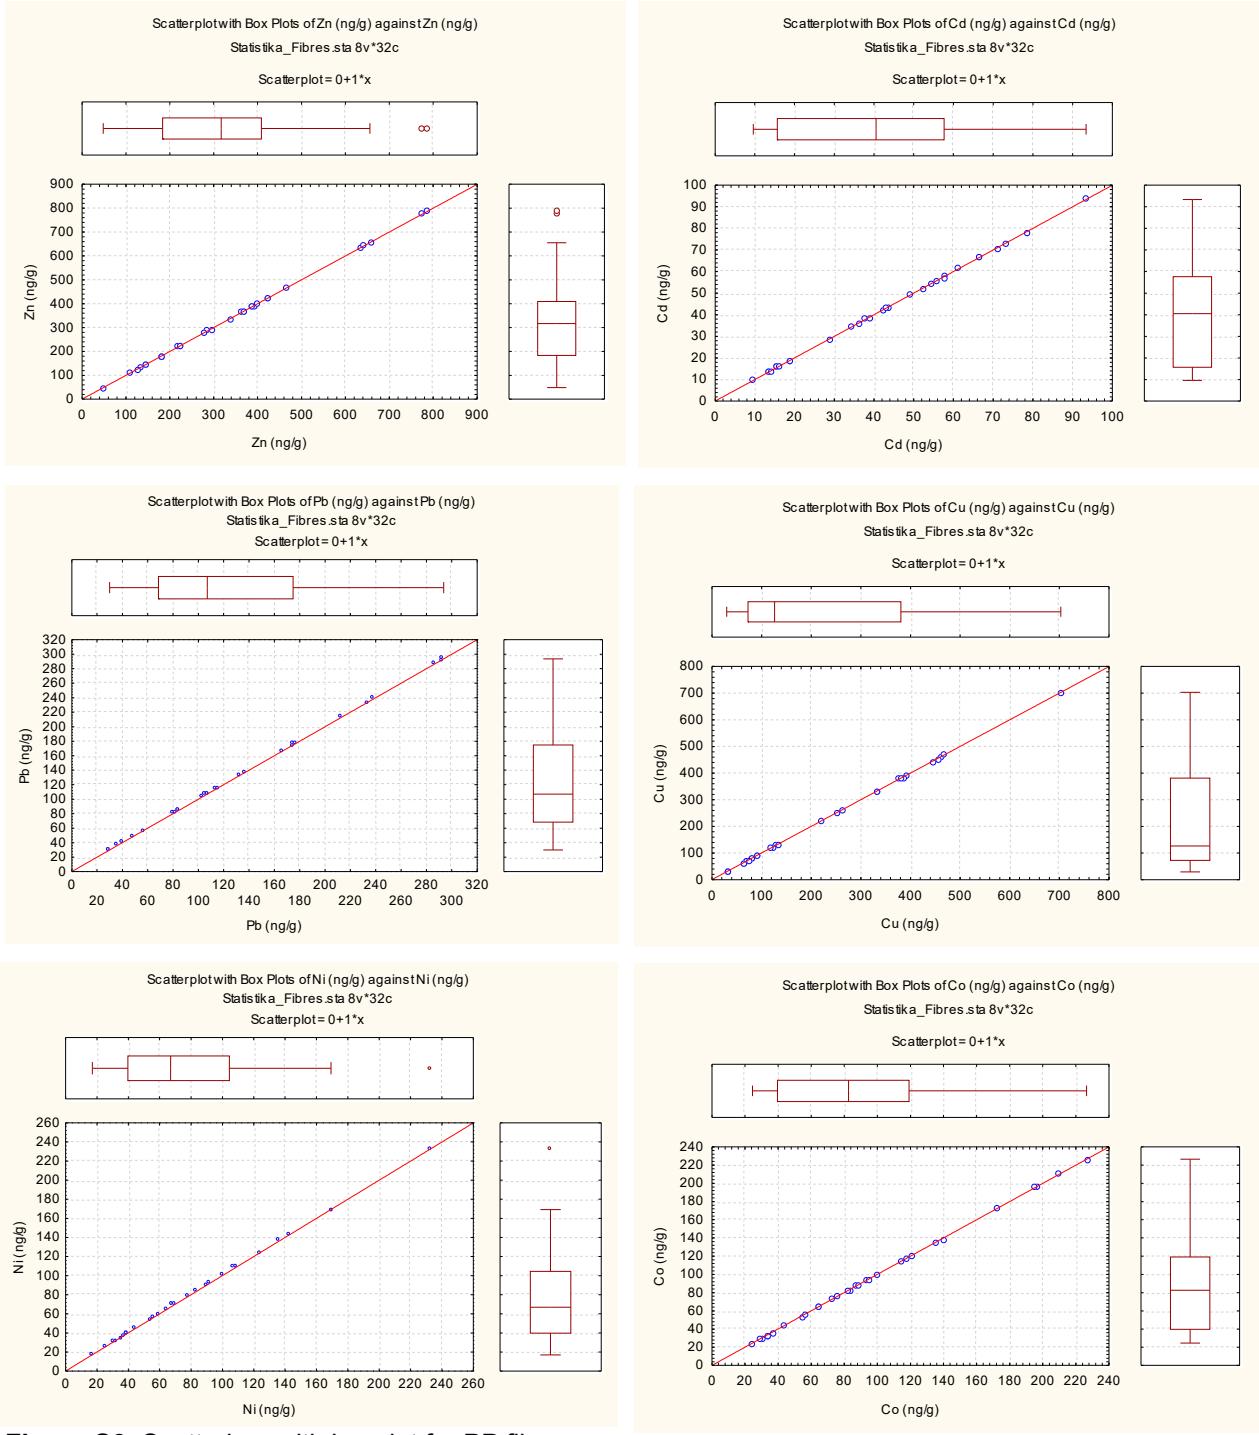

Figure S3. Scatterbox with boxplot for PP fibers.

Chapter S2. Multiple regression analysis with HA concentration as independent variable.
