Figure S1. Effects of ambient pH on the production of main sorbicillinoids in <i>U. virens</i> . (A) Chemical structures of trichotetronine, demethylthyltrichodimerol and trichodimerol; (B) HPLC profiles of the <i>U. virens</i> cultivated in PBGY medium with different ambient pH values.	S3
Figure S2. Comparisons of the colony extension, mycelial growth and sporulation of wild-type (WT) strain P1 and gene deletion mutants ($\Delta UvSorR1$ and $\Delta UvSorR2$) of <i>U. virens</i> cultured on PDA medium at 28 °C for 18 days. The colony diameter (mm), mycelial biomass (mg) and sporulation (conidia/mm ²) were measured to statistical analysis. The error bars represent the standard deviations, and the asterisks represent significant differences at $p < 0.05$. All data showed that $\Delta UvSorR1$ and $\Delta UvSorR2$ mutants had no significant differences with WT strain.	S4
Figure S3. Expressions of global regulator genes in <i>U. virens</i> grown on different carbon and nitrogen sources, ambient pH, and light treatments. Data were analyzed using the $2^{-\Delta\Delta Ct}$ method, and normalized using the β -tubulin as housekeeping gene. (A) Relative expression analysis of <i>UvCreA</i> gene under the various carbon sources; (B) Relative expression analysis of <i>UvAreA</i> gene under the various nitrogen sources; (C) Relative expression analysis of <i>UvPacC</i> gene under different ambient pH; (D) Relative expression analysis of velvet complex (<i>UvLaeA</i> , <i>UvVeA</i> , and <i>UvVelB</i>) under different light exposure treatments. Different letters in each figure mean significant difference according to Duncan's Multiple Range Test ($p < 0.05$).	S5
