

Figure S2. Correlations among propagation traits and growth parameters of grapevine rootstocks. One-year-old vine is the plant developed on the cutting in the first year (2011). Adult vine is the plant during the fifth to seventh growing seasons (2016 – 2018). Asterisks indicate the significances of the correlations: *, $P < 0.05$; **, $P < 0.01$; ***, $P < 0.001$.
