Methods

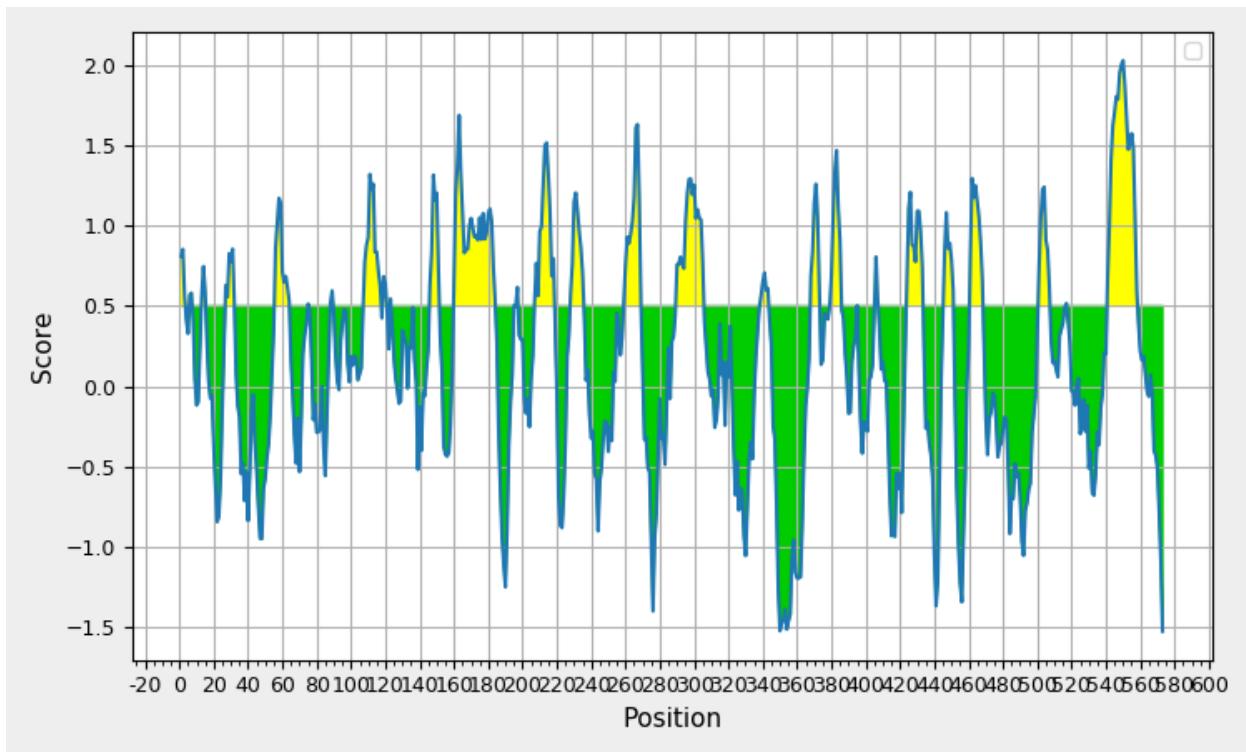

Phylogenetic tree

To accomplish this tree, the evolutionary history was inferred using Neighbor-Joining method using MEGA 11 [45,46]. The bootstrap consensus tree inferred from 1000 replicates is taken to represent the evolutionary history of the taxa and the percentage of replicate tree in which the associated taxa clustered together in the bootstrap test (1000 replicates) are shown next to the branches the evolutionary distances were computed using the p-distance method and are in the units of the number of amino acid differences per site. Branches corresponding to partitions reproduced in less than 50% of bootstrap replicates are collapsed. There was a total of 270 positions in the final data set [46].

Amino acid composition

To identify the amino acid composition, the Expasy ProtParam (<https://web.expasy.org/protparam/protparam-doc.html>) [49] tool was used for VM protein, and the result was plotted, analyzed, and synchronized. To consolidate this information, the heatmap with amino acid content was constructed using the heatmap2 function of package gplots.

Data

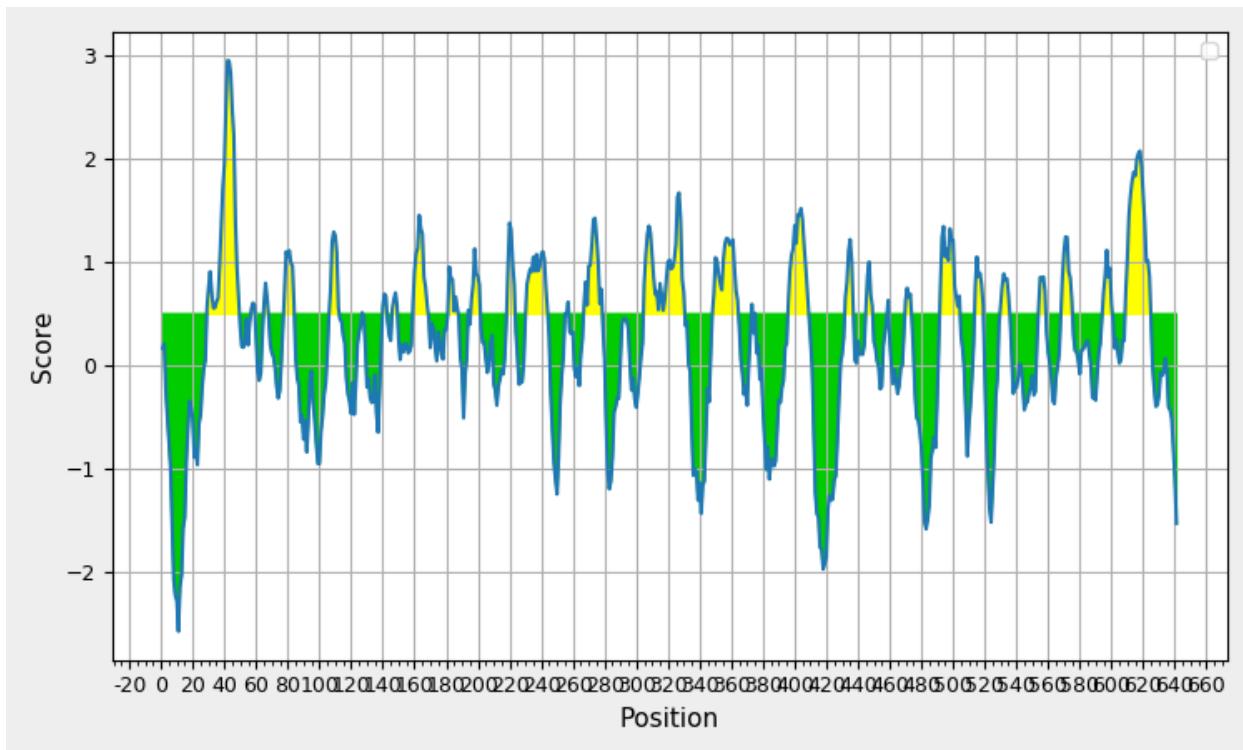

Supplementary Figure S1. Epitope analysis based on iedb.org from the amino acid sequence of *Leptospira interrogans* Lai, LA1400 which has the ortholog LIC_12340. The yellow color indicates possible epitope positions. Considerable analysis data: average (0.176), minimum (-0.001), and maximum (2.029).

Supplementary Table S1. Predicted peptides analysis of the amino acids sequence from *Leptospira interrogans* Lai, protein LA1400, based on iedb.org server.
