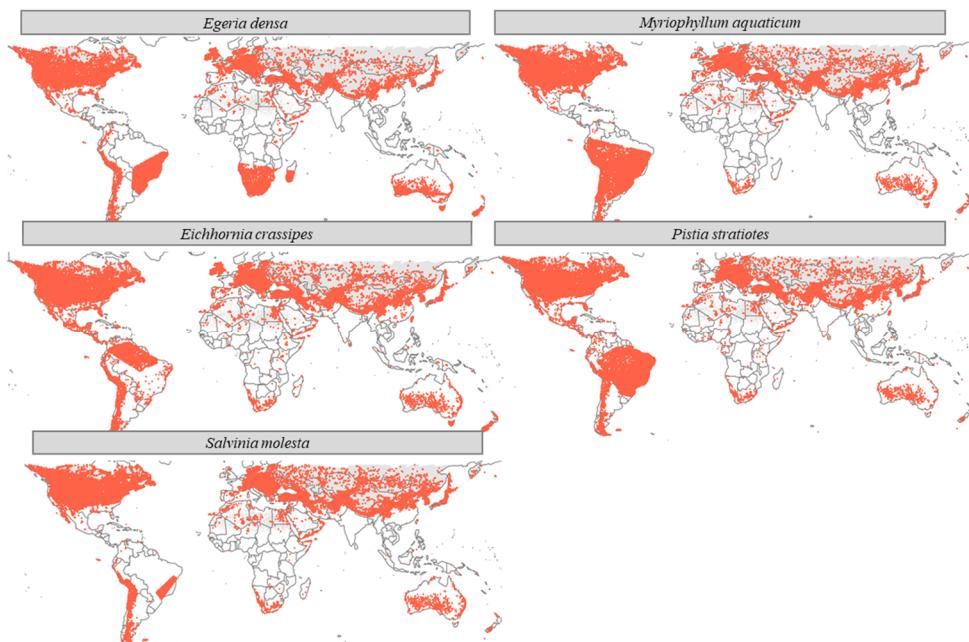

Figure S1. Selected background grid cells used in the modelling of *Egeria densa*, *Eichhornia crassipes*, *Myriophyllum aquaticum*, *Pistia stratiotes* and *Salvinia molesta*.

Table S1. Number of occurrences before (raw data) and after cleaning procedure and numbers of grid cells with presences used for modelling.

Species	Occurrences before cleaning procedure	Occurrences after cleaning procedure	Grid cells with recorded occurrences
<i>Egeria densa</i>	5,508	652	645
<i>Eichhornia crassipes</i>	22,544	3210	1077
<i>Myriophyllum aquaticum</i>	15,304	1485	637
<i>Pistia stratiotes</i>	18,004	1688	817
<i>Salvinia molesta</i>	5,740	704	237

Table S2. Summary of the cross-validation predictive performance (AUC and TSS) and variable importance of the fitted model algorithms and the ensemble (AUC-weighted average of the best performing seven algorithms) for five South American occurring elsewhere as invasive non-native species. Variable importances are given as percentages for Hydro6 (mean minimum temperature

of coldest month), Hydro10 (mean temperature of warmest quarter) and Hydro18 (precipitation of warmest quarter) and Global lakes and wetlands.

Species	Algorithm	TSS	ROC	Variable importance (%)			
				Minimum Upstream Temperature of Coldest Month	Mean Upstream Temperature of Warmest Quarter	Upstream Precipitation of Warmest Quarter	Global lakes and wetlands
<i>Egeria densa</i>	GLM	0.469	0.785	64.1	11.2	10.9	13.8
