Multiple Cropping Systems for Improving Crop Yield and Soil Quality—Series II

Message from the Guest Editors

Multiple cropping, defined as harvesting more than once a year, plays an important role in increasing cropping intensity and comprehensive production capacity.

Multiple cropping can improve the utilization efficiency of natural resources and reduce agricultural inputs.

Meanwhile, multiple cropping has long been recognized as a way to improve soil quality which could increase the resilience of cropping systems to climate change.

However, with the development of modern agriculture, the improvement of agricultural science and technology, and the maximization of economic and ecological benefits, monoculture is more and more prevalent across the world. Therefore, vigorously promoting the new patterns and technologies of multiple cropping is a necessary way to maintain the sustainable development of agriculture in the world, especially in developing countries. To this end, it is particularly important to systematically study the effects of multiple cropping on yield and soil quality. In this Special Issue, we aim to exchange new progress and the discovery of yield and soil quality effects under multiple cropping and provide a theoretical basis for the development of multiple cropping.

About the Journal

Message from the Editor-in-Chief

Agronomy draws together researchers from diverse areas of agricultural research with a common aim of enhancing agricultural productivity globally. The journal provides unlimited free access to all those interested in advancing agricultural science from both the research and general community. Papers are released immediately after acceptance through the internet.

Agronomy is supported by our authors and their institutes through low article processing charges (APC) for accepted papers. We hope you will support the journal by becoming one of our authors.

Editor-in-Chief

Charles Sturt University, Wagga Wagga, NSW 2678, Australia

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubAg, AGRIS, and other databases.

Journal Rank:

JCR - Q1 (Plant Sciences) / CiteScore - Q1 (Agronomy and Crop Science)
