Scion-Rootstock Interaction in Horticultural Crops: Physiological and Agronomic Implications

Message from the Collection Editors

Grafting of perennial and seasonal crops provides opportunities to exploit natural genetic variation for specific root traits to influence the phenotype of the scion. By selecting a suitable rootstock, grafting can manipulate scion morphology and physiology and can manage biotic as well as abiotic stresses. This Special Issue invites articles dissecting grafting as a sustainable agro technology for enhancing tolerance to abiotic stresses and reducing disease damage. Of interest are also potential contributions dealing with genetic resources for rootstock breeding, practices and technologies of rootstock breeding, rootstock-scion signaling as well as the physiological and molecular mechanisms underlying graft compatibility. In addition, the effect of grafting on vegetable quality, practical applications and nursery management of grafted seedlings will be considered within the general scope of the Special Issue.

About the Journal

Message from the Editor-in-Chief

Agronomy draws together researchers from diverse areas of agricultural research with a common aim of enhancing agricultural productivity globally. The journal provides unlimited free access to all those interested in advancing agricultural science from both the research and general community. Papers are released immediately after acceptance through the internet.

Agronomy is supported by our authors and their institutes through low article processing charges (APC) for accepted papers. We hope you will support the journal by becoming one of our authors.

Editor-in-Chief

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubAg, AGRIS, and other databases.

Journal Rank:

JCR - Q1 (Plant Sciences) / CiteScore - Q1 (Agronomy and Crop Science)
