

Special Issue

Antibiotic Use in the Communities

Message from the Guest Editors

Antimicrobial resistance has rapidly increased and become a major threat to global public health. Antimicrobial resistance is accelerated by the reckless use of antibiotics in health care by health care workers and the public as well as in agriculture. Hence, the reason for the increase in antimicrobial resistance is, to a large degree, behavioral. In addition to appropriate prescription and use of antibiotics, other behavioral measures to prevent infections, such as maintaining vaccines and hygiene, help to prevent antibiotic resistance. This Special Issue, "Antibiotic Use in the Community", focuses on behavioral aspects of antibiotic use and infection prevention in the community. Papers addressing the great variety of behavioral aspects in antibiotic use and infection control are welcome. These can include socioeconomic, cultural, educational, and psychological studies, and can be based on any research design from quantitative to qualitative studies and macro-level indicators.

About the Journal

Message from the Editor-in-Chief

There are very few fields that attract as much attention as scientific endeavor related to antibiotic discovery, use and preservation. The public, patients, scientists, clinicians, policy-makers, NGOs, governments, and supra-governmental organizations are all focusing intensively on it: all are concerned that we use our existing agents more effectively, and develop and evaluate new interventions in time to face emerging challenges for the benefit of present and future generations. We need every discipline to contribute and collaborate: molecular, microbiological, clinical, epidemiological, geographic, economic, social scientific and policy disciplines are all key. *Antibiotics* is a nimble, inclusive and rigorous indexed journal as an enabling platform for all who can contribute to solving the greatest broad concerns of the modern world.
