

Special Issue

New Developments in Geometric Function Theory

Message from the Guest Editor

This special issue aims to gather the latest developments in the research concerning complex-valued functions from Geometric Function Theory point of view. Contributions are expected regarding any aspects of subordination and superordination results, different types of operators specific to the research in this field, special functions connected to univalent functions' theory. Hopefully, new approaches would emerge regarding the introduction and study of special classes of univalent functions using operators and the classical theories of differential subordination and superordination as well as the newer adapted theories of strong differential subordination and superordination and fuzzy differential subordination and superordination. Authors are invited to submit their latest results related to analytic functions in all their variety and also related to their applications in other fields of research. Quantum calculus and its applications in Geometric Function Theory is also expected to provide interesting outcome. Presentation of results obtained by using any other techniques which can be applied in the field of complex analysis and its applications are welcome.

About the Journal

Message from the Editor-in-Chief

Axioms is dedicated to the foundations (structure and axiomatic basis, in particular) of mathematical theories, not only from a crisp or strictly classical sense, but also from a fuzzy and generalized sense. This includes the more innovative current scientific trends, devoted to discover and solve new challenging problems. The prime goal of *Axioms* is to publish first-class, original research articles under an open access policy with minimal fees for the authors. We would be pleased to welcome you as one of our authors.
