Clinical Research and Recent Advances in Paediatric Allergic Diseases

Message from the Guest Editor

Food allergy prevention trials show that the introduction of peanut protein in infancy prevents peanut allergy in a high-risk population and the introduction of egg before 6 months of age is likely to be beneficial in preventing egg allergy in the general population. Trials of food desensitization also show promise in increasing the threshold of reaction, providing some reassurance to families that accidental exposure to an allergen via cross contamination is unlikely to cause a severe reaction. Trials of immune-modulating treatments for asthma and eczema have resulted in improvements in the treatment of children with severe disease. Despite these recent advances, there are still many unanswered questions regarding the best way to prevent paediatric allergic disease, halt the atopic march, treat those who have these conditions, and reduce the burden of allergic disease on children, their families, and society. We welcome manuscripts that address any of these issues.

About the Journal

Message from the Editor-in-Chief

You are invited to contribute a research article or comprehensive review for consideration and publication in *Children* (ISSN 2227-9067). *Children* is an open access journal—research articles, reviews, and other content are published online immediately after acceptance. The scientific community and the general public have unlimited free access to the content as soon as it is published. The journal focuses on sharing clinical, epidemiological, and translational science relevant to children's health. We would be pleased to welcome you as one of our authors.

Editor-in-Chief

Prof. Dr. Paul R. Carney

Departments of Child Health and Neurology, University of Missouri, 400 Keene Street, Columbia, MI 65201, USA

Author Benefits

Open Access

— free for readers, with article processing charges (APC) paid by authors or their institutions.
