Climate and Human-Driven Impacts on Tropical Rainforests

Message from the Guest Editors

Tropical rainforests are a treasure trove of biodiversity. However, intensifying anthropic pressure and associated land cover changes have led to large-scale forest loss. These rainforests influence the terrestrial climate system through exchanges of energy, carbon dioxide, and water between the earth's surface and the atmosphere. In addition to providing water vapor to the environment through evapotranspiration, influencing general circulation in the tropics, and contributing to regional precipitation, tropical rainforests play an important role in the global carbon cycle. Climate-change-induced increases in temperature and reductions in precipitation are triggering forest degradation, with some parts of tropical rainforests already becoming a carbon source. Additionally, climate extremes are also impacting these forests, which are losing resilience. To develop a comprehensive understanding of the complex forest–climate extremes interactions, it is necessary to focus on different processes affecting biodiversity loss and ecosystem services. We look forward to receiving all aspects of your contributions to our joint Special Issue in *Climate* and *Fire*.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Dr. Timothy G. F. Kittel
Institute of Arctic and Alpine Research, University of Colorado Boulder,
Boulder, CO 80309-0450, USA

Author Benefits

High Visibility:

indexed within Scopus, ESCI (Web of Science), GeoRef, AGRIS, and other databases.

Journal Rank:

JCR - Q2 (Meteorology and Atmospheric Sciences) /
CiteScore - Q2 (Atmospheric Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 21.9 days after submission; acceptance to publication is undertaken in 3.8 days (median values for papers published in this journal in the first half of 2024).
