Ecological Niche Modelling under Climate Change

Message from the Guest Editor

Climate change is considered a major threat to our ecosystems. Climate is the primary factor regulating geographic distributions of many plant and animal species. Many species on the earth are adapted to a range of climatic conditions (i.e., climatic niche). Unprecedented rapid climate change will likely cause a mismatch between the climate that a species historically adapted to and the climate that the species will experience in the future. Such a mismatch is likely to compromise the health and productivity of the species in future climates. Ecological niche models have been widely used to predict ecological niches of species and provide a scientific basis for developing adaptive strategies. Manuscripts that address the issues in development and applications of ecological niche models are welcome for this Special Issue.

Boulder, CO 80309-0450, USA

Author Benefits

High Visibility:

indexed within Scopus, ESCI (Web of Science), GeoRef, AGRIS, and other databases.

Journal Rank:

JCR - Q2 (Meteorology and Atmospheric Sciences) /
CiteScore - Q2 (Atmospheric Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 21.9 days after submission; acceptance to publication is undertaken in 3.8 days (median values for papers published in this journal in the first half of 2024).
