All-Digital Time-Mode Approaches for Mixed Analog-Digital Signal Processing

Message from the Guest Editor

The rapid advance of CMOS technology has been geared towards optimizing the performance of digital circuits. Analog circuits not only continue to lose the benefit of specialized and process-controlled components, they must also cope with a rapidly shrinking voltage headroom, deteriorating device mismatch, and worsening linearity while satisfying ever stringent performance specifications. Time-mode signal processing where information is represented by the time difference between the occurrence of two digital events rather than the nodal voltages or branch currents of electric networks offer a viable and technology friendly means to combat difficulties encountered in design of mixed analog-digital systems. The circuits are essentially digital systems capable of performing analog and mixed analog-digital signal processing without using power-greedy and speed-impaired digital signal processors. Time-mode circuits possess a number of intrinsic and attractive characteristics, such as compatibility with technology scaling, programmability, portability, immunity to disturbances and noise, and a short design cycle, to name a few that are not possessed by their analog counterparts.

About the Journal

Message from the Editor-in-Chief

Electronics is a multidisciplinary journal designed to appeal to a diverse audience of research scientists, practitioners, and developers in academia and industry. The journal is devoted to fast publication of latest technological breakthroughs, cutting-edge developments, and timely reviews of current and emerging technologies related to the broad field of electronics. Experimental and theoretical results are published as regular peer-reviewed articles or as articles within Special Issues guest-edited by leading experts in selected topics of interest.

Editor-in-Chief

Prof. Dr. Flavio Canavero

Department of Electronics and Telecommunications, Politecnico di Torino, 10129 Torino, Italy

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), CAPlus / SciFinder, Inspec, Ei Compendex and other databases.

Journal Rank:

JCR - Q2 (Physics, Applied) / CiteScore - Q2 (Control and Systems Engineering)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16.8 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2024).
