Behavioral Coalition Formation: Theory and Experiments

Message from the Guest Editors

Both cooperative game theory and non-cooperative game theory offer a wide variety of approaches to the question of coalition formation. Over the last few decades, coalition formation theories have been applied to many important economic issues such as the formation of economic unions, the governance of global public goods and the stability of political parties. However, empirical evidence on the coexistence of small and large groups, instead of a grand Pareto-superior coalition, challenged the theoretical framework. Advances in cooperative and in non-cooperative game theory have provided new insights in coalition formation with heterogeneous groups at equilibrium. Yet many aspects of the process of coalition formation are not well understood. Progress in experimental design and behavioral modelling can shed new light on the roots of the formation and stability of coalitions. In this Special Issue, we wish to gather recent contributions, either theoretical or experimental, on the issue of coalition formation with a special focus on behavioral approaches.

Author Benefits

High Visibility:

indexed within Scopus, ESCI (Web of Science),
MathSciNet, zbMATH, RePEc, EconLit, EconBiz, and other
databases.

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 22.6 days after
submission; acceptance to publication is undertaken in 3.9
days (median values for papers published in this journal in
the first half of 2024).

Recognition of Reviewers:

reviewers who provide timely, thorough peer-review
reports receive vouchers entitling them to a discount on
the APC of their next publication in any MDPI journal, in
appreciation of the work done.
