

## Special Issue

# Progress in the Preventive Therapeutic Pathway of Dental Care: From Prevention and Pre-Operative Management to Treatment and Follow-Up

### Message from the Guest Editors

The World Health Organization considers oral health a key contributor to overall health, well-being, and patient quality of life. Oral health is associated with the teeth, mouth, and oral-facial structure status, which are essential to perform several functions such as breathing, eating, and speaking, as well as encouraging self-confidence, well-being, and socialization without embarrassment or discomfort. The goal of the present research topic is to provide a comprehensive view of the current and future progress in public health regarding the prevention, patient behavior management techniques, therapy, and post-operative and rehabilitation approaches in dental care. In clinical practice, new strategies should facilitate the development of personalized medicine to positively affect the incidence and the disease course.
