Job Satisfaction and Stress among Healthcare Workers

Message from the Guest Editors

Job satisfaction is one of the most important elements influencing employees' attitudes towards work. Dissatisfaction with work is associated with negative phenomena both for the employee—increasing the level of perceived stress—and the organization itself, in the form of reduced work efficiency, reduced involvement in work, greater willingness to leave the organization or reduced attachment to it. These issues are particularly impactful for those working in more stressful situations or struggling with interpersonal tensions. How has psychological anxiety caused by COVID-19 influenced job satisfaction? A new challenge has arisen in terms of maintaining life and job satisfaction in a less predictable environment. We seek papers addressing the above topics, especially those which focus on the biopsychosocial aspects of functioning in the workplace. Papers that suggest practical solutions and applications for improving the functioning of employees and the organization are of particular importance. Works focused not only on the COVID-19 pandemic, but also those on the economic and migration crisis related to institutions and aid organizations, are also of interest.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.

Editor-in-Chief
