

Special Issue

The Associations between Eating Disorders and Psychological Health

Message from the Guest Editor

Eating Disorders (ED) are serious health conditions with high rates of psychiatric comorbidity, medical complications, and elevated mortality risk, thus representing a significant public health problem. This Special Issue will highlight cutting-edge research on the associations between ED pathology and psychological health. Of particular interest are studies that emphasize the following areas: (1) unique and shared risk factors in understudied or under-represented populations; (2) trajectories of ED pathology and psychological health; shared resilience factors related to ED pathology and psychological health; (3) novel examination of social, environmental, policy, or interactional factors relevant in comorbid disordered eating and psychopathology (e.g., weight stigma, intersectionality, and food insecurity); (4) intervention/prevention studies targeting EDs and comorbid psychopathology; (5) inter- and multi-disciplinary efforts to identify new understandings through collaboration; and (6) the application of new models or techniques to understand the associations between EDs and psychological health.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.
