Health Impacts of Overweight and Obesity in Children

Message from the Guest Editors

The World Health Organization considers overweight (OW) and obesity (OB) in children as one of the most serious public health challenges of the 21st century due to its rapid growth. In this sense, the previous literature has not only noted a link between several clinical comorbidities, such as diabetes or metabolic syndrome, in children who have OW or OB, but also an association between OB and a higher risk of injury with respect to gait, plantar pressures and stability. These are the main causes of pain in the feet and lower limbs in children. However, there is still controversy regarding the level of association between OW and OB and gait disturbance in children because, while some studies reported that children with OW and OB have weaker stability, a flatter foot pattern and a larger axis of the foot than normal-weight children, which seems to impact plantar pressures, provoke pain, and affect their quality of life, other studies described no relationship between the OW and OB with foot pronation.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.
