Reproductive Therapy and Perinatal Outcome

Message from the Guest Editor

Assisted reproductive technology (ART) has advanced significantly in recent years, and the incidence of pregnancy by ART has increased. Currently in Japan, 1 in 18 women give birth because of ART. The number of babies born by ART is also predicted to increase in the future. Therefore, perinatal outcomes for pregnancy by ART need to be understood. Currently, pregnancies by ART are known to be associated with a high rate of premature birth, low-birth-weight infants, fetal malposition, an abnormal placenta and umbilical cord, a high rate of cesarean section, perinatal mortality, and a high amount of blood loss during delivery. However, perinatal outcomes for pregnancy by ART are not yet understood in their entirety. This Special Issue seeks research papers on various aspects of women's reproductive health, such as assisted reproductive technology, gynecological diseases, and perinatal outcomes.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.
