Emergence and Re-Emergence of Mumps Virus Infection

Message from the Guest Editor

Mumps is highly infectious and spreads rapidly in susceptible individuals living in close proximity. In the pre-vaccination era, the highest attack rate was among primary school children and most adolescents. Although immunization of two doses of the measles–mumps–rubella (MMR) vaccine is part of a worldwide childhood vaccination program, cases of mumps continue to occur annually, including outbreaks with thousands of cases reported. The reasons for this trend are still unclear. There is a need for further scientific evidence to work on preventing the emergence of mumps virus (MuV) infection.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.

Editor-in-Chief

Prof. Dr. Paul B. Tchounwou

RCMI Center for Urban Health Disparities Research and Innovation,
