Cancer as a Public Health Problem--Prevention of Cancer

Message from the Guest Editors

Cancer diseases are a matter of particular importance because of their health, psychological, and social consequences. They are one of the more severe health problems, as well as one of the leading causes of disability. The number of people living with a history of cancer incidence is estimated at 28 million worldwide. Epidemiologists predict that these numbers will double in the next 15 years. According to WHO, taking into account the epidemiological situation and the forecast for the next 10–20 years, cancer will become the main cause of death in the world of the twenty-first century. The submission of papers exploring both primary and secondary prevention of cancer is encouraged. Primary prevention: preventing cancer illness in healthy people. Secondary prevention: measures to reduce the physical and psychosocial consequences of the illness and prevention of relapse. The listed keywords suggest just a few of the many possibilities.

- Cancer
- Physical activity
- Exercise
- Lifestyle
- Prevention
- Supportive care
- Recovery
- Quality of life

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.
