Hemiptera: Ecology, Physiology, and Economic Importance

Message from the Collection Editors

Hemiptera is one of the largest insect orders playing an important role in both natural and anthropogenic ecosystems. Numerous phytophagous hemipterans cause serious damage to agriculture and forestry, whereas some predatory species are widely used as biocontrol agents. Therefore, investigations conducted on Hemiptera are of interest for both fundamental and applied entomology. This Special Issue aims to represent the current state of the studies on Hemiptera ecology and physiology. Both original research articles and reviews can be submitted; studies on ecophysiology (regulation of seasonal cycles, reproduction, feeding, locomotion, etc.) are particularly welcome; preference will be given to the papers concerning economically important species (both pests and beneficial ones). We look forward to receiving your valuable contributions.

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed,
PMC, PubAg, and other databases.

Journal Rank:

JCR - Q1 (Entomology) / CiteScore - Q1 (Insect Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 17 days after
submission; acceptance to publication is undertaken in 2.8
days (median values for papers published in this journal in
the first half of 2024).
