Improving IPM of Specialty Crop Pests and Global Food Security

Message from the Collection Editors

Insects, weeds, and diseases are posing ever-evolving challenges to global agriculture and food security. Indeed, due to the increasing global population, investments are being made around the world to improve and develop sound scientific approaches to sustain specialty crop production and to provide continued food security in the face of these threats. Integrated pest management (IPM) is the practice of managing invasive and established pests to minimize pest injury using methods that are safe for the environment, humans, and production systems. Globally, pest managers are committed to building upon their past successes to increase implementation of IPM in specialty crops (vegetables, fruits, and nut crops). In recent decades, the most-commonly used method for pest management has been the direct application of agrochemicals. However, in response to environmental, economic, and other problems associated with overreliance on synthetic chemicals, there has been an increasing drive towards the development and improvements of integrated pest management (IPM) strategies in specialty crops. Many IPM strategies are now well-developed under protected crop production settings.

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, PubAg, and other databases.

Journal Rank:

JCR - Q1 (Entomology) / CiteScore - Q1 (Insect Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 17 days after submission; acceptance to publication is undertaken in 2.8 days (median values for papers published in this journal in the first half of 2024).
