Biological Control of *Halyomorpha halys* with Special Emphasis on Parasitoids

Message from the Guest Editors

Halyomorpha halys is a destructive agricultural pest of East Asian origin. Damages on fruits and vegetables are severe, and control methods are generally biased toward chemical pesticides. This approach rarely leads to satisfactory pest control and often disrupts IPM strategies. Biological control, especially with egg parasitoids, is considered one of the most viable long-term solutions. In many regions of the world, classical or augmentative biological control by exotic and native parasitoid species is actively under investigation. Moreover, adventive populations parasitoids associated with brown marmorated stink bug (BMSB) eggs have been discovered in North America and Europe, emphasizing the need for a cosmopolitan perspective for solving this pest problem. This Special Issue welcomes papers on various aspects of the biological control of *H. halys*, in particular with parasitoids.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. Brian T. Forschler
Department of Entomology, University of Georgia, 413 Biological
Sciences Building, Athens, GA 30602-2603, USA

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed,
PMC, PubAg, and other databases.

Journal Rank:

JCR - Q1 (Entomology) / CiteScore - Q1 (Insect Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 17 days after
submission; acceptance to publication is undertaken in 2.8
days (median values for papers published in this journal in
the first half of 2024).
