Special Issue

Plant Resistance Against Plant Viruses and Pests

Message from the Guest Editors

Pest insects do not only cause direct damage to plants by the withdrawal of nutrients but are also able to transmit viruses causing severe diseases in plants, e.g. affecting yield amount and quality. For a long time, the control of significant insect pests and plant viruses relied on the use of insecticides. Due to efforts to reduce the amount of pesticides applied, e.g. by banning the use, it is necessary to place other components of integrated pest management in the focus. Plant resistance to insects and viruses is one of these components. Here we give an overview of recent advances in this field with a focus on the identification of resistance genes, molecular mechanisms of resistance, phenotyping of resistance and the tritrophic interaction between viruses, their vectors and host plants.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. Brian T. Forschler

Department of Entomology, University of Georgia, 413 Biological Sciences Building, Athens, GA 30602-2603, USA

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, PubAg, and other databases.

Journal Rank:

JCR - Q1 (Entomology) / CiteScore - Q1 (Insect Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 17 days after submission; acceptance to publication is undertaken in 2.8 days (median values for papers published in this journal in the first half of 2024).
