Isolation and Control of Fruit and Vegetable Rot Fungi

Message from the Guest Editors

Fruit and vegetable rot caused by pathogens is an important factor causing economic losses to farmers. Fruits and vegetables are susceptible to pathogens at multiple stages before and after harvest, resulting in severe postharvest product decay and huge economic losses. The host range and pathogenicity of pathogens isolated in different regions vary greatly, which is the result of pathogens adapting to the local environment. Therefore, isolation and identification of region-specific strains are crucial for the development of strain-specific antifungal agents. Presently, the main control practice for postharvest disease is using synthetic chemical fungicides. However, problems associated with the use of these chemicals (health, environmental, and emergence of resistant strains) have increasingly become prominent. For this reason, we encourage manuscripts on the isolation of fruit and vegetable pathogens that have not yet been reported, the development of new control measures for fruit and vegetable diseases, and antifungal mechanisms of agents, to be submitted to a Special Issue of the *Journal of Fungi* on "Isolation and Control of Fruit and Vegetable Rot Fungi".

About the Journal

Message from the Editor-in-Chief

The *Journal of Fungi* (JoF, ISSN 2309-608X) is an international, peer-reviewed, scientific, open access journal that provides an advanced forum for studies related to pathogenic fungi, fungal biology, and all other aspects of fungal research. Research articles, reviews and other contents are released on the Internet immediately after acceptance. The scientific community and the general public have unlimited free access to the content as soon as it is published. We would be pleased to welcome you as one of our authors.

Editor-in-Chief

Prof. Dr. David S. Perlin
