New Trends in Reducing Friction and Power Loss in Bearings

Message from the Guest Editor

Fluid film bearings are the most common choice for land-based turbomachinery, pumps, and other heavy-duty processing machines. The lifting force generated in the film wedge guarantees the correct operation of these bearings, and with proper lubrication, they can have an almost infinite life. However, large shear stress in the oil is also generated, resulting in a significant power loss. Conversely, rolling element bearings are the best choice for small machines operating at low speed. In fact, reducing friction in the bearings significantly increases the process efficiency. For this reason, considerable effort has been devoted to finding ways to reduce power loss in bearings. Topics of interest include, but are not limited to, the following:

- Fluid film bearings;
- Rolling element bearings;
- Power loss reduction;
- Friction reduction;
- Thermoelastic hydrodynamic lubrication;
- Lubricant additives and friction reducers;
- Fluid film bearings operation optimization;
- New materials;
- Fluid film bearings geometry optimization.

About the Journal

Message from the Editor-in-Chief

Machines is an international, peer reviewed journal on machinery and engineering. It publishes research articles, reviews and communications.

Our aim is to encourage scientists to publish their experimental and theoretical results in as much detail as possible. There is no restriction on the length of the papers. Full experimental and/or methodical details must be provided.

There are, in addition, unique features of this journal: Manuscripts regarding research proposals and research ideas will be particularly welcomed; Electronic files or software regarding the full details of the calculation and experimental procedure - if unable to be published in a normal way can be deposited as supplementary material.

Editor-in-Chief

Prof. Dr. Antonio J. Marques Cardoso

CISE - Electromechatronic Systems Research Centre, University of Beira Interior, Calçada Fonte do Lameiro, P-6201-001 Covilhã, Portugal

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, and other databases.

Journal Rank:

JCR - Q2 (Engineering, Mechanical) / CiteScore - Q2 (Control and Optimization)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 15.5 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the second half of 2024).
