

## Special Issue

# Advances in the Management of Shoulder Pathologies

### Message from the Guest Editors

Shoulder pathologies are one of the most common musculoskeletal problems. They encompass a broad range of different conditions, including dislocations, rotator cuff tears, and osteoarthritis. They produce pain and loss of function of the affected arm, being one of the major causes of reduced work activities, with decreased health-related quality of life and representing a high cost for national health systems. In recent years, orthopedics has embraced innovations and new techniques with the aim to improve the standard of care and reduce associated costs. Therefore, the purpose of this Special Issue is to highlight new advances in the field of shoulder disease, taking into account pathogenic factors, bio-engineering, new implants, and the use of new technologies.
