Selective Laser Melting: Microstructure and Properties Optimization for Metals and Alloys, Metal Matrix Composites, Lattice and Hybrid Parts

Message from the Guest Editors

Selective laser melting (SLM) is an interesting technology for the manufacture of high-performance metal components. A broad range of metallic alloys have been processed by SLM, such as aluminum alloys, titanium alloys, iron–steel alloys, nickel alloys, cobalt alloys, copper alloys, and their combinations or composites. Over the last decade, SLM has been significantly improved in terms of the technological capability and quality of the parts. Some SLM components have already been applied in many fields, such as in the aerospace, biomedical, and automotive industries. The focus of this Special Issue is on exploring the possibility of tuning process parameters and post-processing techniques and heat treatments for the optimization of microstructure features, defects, and properties of metals and alloys. We welcome all original research articles and reviews regarding: SLM of metallic alloys (for aerospace, automotive, and biomedical applications); SLM metal-matrix composites; SLM hybrid metal components; SLM lattice structure.

About the Journal

Message from the Editorial Board

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Editors-in-Chief

Prof. Dr. Hugo F. Lopez

Department of Materials Science and Engineering, College of Engineering & Applied Science, University of Wisconsin-Milwaukee, 3200 N. Cramer Street, Milwaukee, WI 53211, USA

Prof. Dr. Yong Zhang

Beijing Advanced Innovation Center of Materials Genome Engineering, State Key Laboratory for Advanced Metals and Materials, University of Science and Technology Beijing, 30 Xueyuan Road, Beijing 100083, China

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, CAPIus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Metallurgy and Metallurgical Engineering) /
CiteScore - Q1 (Metals and Alloys)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16.5 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2024).
