Corrosion and Tribocorrosion Behavior of Ti Alloys

Message from the Guest Editor

Ti and its alloys present a set of more attractive properties than other metallic materials, such as high biocompatibility, good mechanical properties, and excellent corrosion resistance. Ti and its alloys' excellent corrosion behavior is due to spontaneous compactification and protective nanometric oxide layer formed at its surface, mainly TiO₂, when in contact with air. However, the low wear resistance of that layer is a concern. Tribocorrosion is defined as a combined action between corrosion and mechanical actions, and it affects a large number of engineering systems such as biomedical devices, cutting/drilling tools or transportation industries. Thus, tribocorrosion plays an important role on the lifetime of these systems. The Special Issue aims to provide the state-of-the-art findings on corrosion and tribocorrosion behavior of Ti alloys ranging from biomedical to automotive or aerospace applications. Accordingly, the Special Issue will gather papers dealing with novel and progressive research, together with review papers giving an overview and new insights into corrosion, fretting, and tribocorrosion behavior of Ti Alloys.

About the Journal

Message from the Editorial Board

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Editors-in-Chief

Prof. Dr. Hugo F. Lopez

Department of Materials Science and Engineering, College of Engineering & Applied Science, University of Wisconsin-Milwaukee, 3200 N. Cramer Street, Milwaukee, WI 53211, USA

Prof. Dr. Yong Zhang

Beijing Advanced Innovation Center of Materials Genome Engineering, State Key Laboratory for Advanced Metals and Materials, University of Science and Technology Beijing, 30 Xueyuan Road, Beijing 100083, China

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, CAPIus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Metallurgy and Metallurgical Engineering) /
CiteScore - Q1 (Metals and Alloys)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16.5 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2024).
