

## Special Issue

# Deformation and Transformation Twinning

### Message from the Guest Editor

Deformation twinning is a stress-induced lattice distortion that transforms a crystal into another crystal of same phase but with a different orientation. Some twins are associated with abnormally low Schmid factors, or are of pure stretch type (“zero-shear”), which challenges the classical theories. The nature of transformation twinning is different. Transformation twins are actually variants generated by a phase transformation, and the twin law results from the broken parent symmetries. This indirect relation between the twins may be confusing, and one may think that a variant can be transformed into another variant via the usual (shear) deformation twinning mechanism. This assumption is the cornerstone of the phenomenological theory of martensitic crystallography (PTMC) to explain the shape memory effect. However, there is no direct evidence that shows that such a simple shear mechanism is the correct one. A lot of important questions remain open. All contributions are welcome in this Special Issue, including critical and constructive reviews, new surprising experimental results, even if not yet fully understood and interpreted, etc.

## About the Journal

### Message from the Editorial Board

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

### Author Benefits

#### High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, CAPIus / SciFinder, and other databases.

#### Journal Rank:

JCR - Q2 (Metallurgy and Metallurgical Engineering) /  
CiteScore - Q1 (Metals and Alloys)

#### Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16.5 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2024).
