Host-Pathogen Interaction Involved in *Trypanosoma cruzi* Infection

Message from the Guest Editors

Chagas disease, or American trypanosomiasis, caused by the protozoan parasite *Trypanosoma cruzi*, is a silent, underdiagnosed and life-threatening disease. It constitutes a significant public health issue not only in Latin America, but also worldwide. The probability of acquiring the disease depends on multiple factors: the parasite, the vectors, the mammalian hosts (including the human being), and socioeconomic aspects. Particularly, the host–pathogen interaction is a key factor determining the probability of infection and establishment of the disease. Thus, studying these different aspects is essential to understanding the pathogenesis of the disease and to improving the diagnostic and therapeutic tools for *Trypanosoma cruzi* infection. Therefore, for this Special Issue of *Pathogens*, we invite you to submit your contributions in the form of original research articles, review papers, and short communications about host–*Trypanosoma cruzi* interactions. We look forward to your contributions and thank you very much for your collaboration.

About the Journal

Message from the Editor-in-Chief

The worldwide impact of infectious disease is incalculable. The consequences for human health in terms of morbidity and mortality are obvious and vast but, when infections of animals and plants are also taken into account, it is hard to imagine any other disease that has such a significant impact on our lives—on healthcare systems, on agriculture and on world economics.

Pathogens is proud to continue to serve the international community by publishing high quality studies that further our understanding of infection and have meaningful consequences for disease intervention.

Editor-in-Chief
