Smart Pixels and Imaging

Message from the Guest Editors

The growing experience with photosensors functionality has led to the development of a large variety of modular building blocks for smart pixels and high-performance image-sensing solutions. Examples include in-pixel amplifiers and avalanche-effect pixels for single-photon resolution at room temperature (including Quanta pixels), non-linear pixel response for high-dynamic-range imagers reaching 200 dB D/R, lock-in pixels for optical time-of-flight range cameras with sub-millimeter distance resolution, high-speed pixels and sensors for image acquisition at 100 million frames per second, or OCT-imagers with in-pixel demodulation circuits for miniaturized, real-time optical coherence tomography 3D imaging systems. These smart-pixel capabilities open the door to new high-performance photonic microsystems, either by implementing known optical measurement techniques in a more efficient way, or by realizing novel photonic sensing approaches, whose realization requires the availability of unconventional pixel and image sensing functionality at the limits imposed by physics.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. Nelson Tansu
School of Electrical and Electronic Engineering (EEE), The University of
Adelaide, Adelaide, SA 5005, Australia

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec,
CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Optics)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 14.9 days after
submission; acceptance to publication is undertaken in 1.9
days (median values for papers published in this journal in
the second half of 2024).
