

Special Issue

Coherent and Polarization Optics

Message from the Guest Editors

Coherence and polarization are two of the intrinsic properties of a light field. Extensive research has shown that both of them play a crucial role in determining the light beam propagation and light–matter interaction. The manipulation of coherence and polarization has been recognized as an available method to produce many peculiar physical phenomena, which can be superior in some of these applications, such as free-space optical communications, microdensitometry, optical information processing, and plasmonics. This Special Issue aims to discuss the latest advances on coherent and polarization optics. Although recent interest in the manipulation of coherence and polarization has been increasing and many structured light beams with prescribed distribution of coherence or polarization have been synthesized, most of them have been limited to one-dimensional control. The combination of coherence and polarization may produce novel and beneficial effects. Therefore, this Special Issue encourages discussions on many novel physical features caused by the joint manipulation of optical coherence and polarization.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. Nelson Tansu
School of Electrical and Electronic Engineering (EEE), The University of
Adelaide, Adelaide, SA 5005, Australia

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec,
CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Optics)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 14.8 days after
submission; acceptance to publication is undertaken in 2.6
days (median values for papers published in this journal in
the first half of 2024).
