

Special Issue

Promising Technologies and Methods to Ensure Sustainable Crop Production

Message from the Guest Editors

The efficient sustainable production of plant-based food resources is an important milestone for the entire agricultural sector in the context of ongoing climate change. Effective approaches in this evolving, sustainable production and research direction can represent revolutionary contributions in the improvement of crop and food production and the reduction of the ecological impact on the valuable environment. This Special Issue targets modern, gentle, and precise approaches in the production of agricultural and horticultural crops; effective pathogen diagnosis; plant protection; and breeding and introduction of low-input crops, resistant varieties, or varieties and species with low ecological burden in the new growing environment. Research contributions which in essence bring progress in this area are acceptable. Contributions bringing comprehensive solutions to the described problem are welcome, as are those presenting significant or revolutionary solutions to partial aspects of crop production or food production and related fields.

About the Journal

Message from the Editor-in-Chief

I encourage you to contribute a research or comprehensive review article for consideration for publication in *Sustainability*, an international Open Access journal which provides an advanced forum for research findings in areas related to sustainability and sustainable development. *Sustainability* publishes original research articles, review articles and communications. I am confident you will find the journal contributes to enhancing understanding of sustainability and fostering initiatives and applications of sustainability-based measures and activities.

Editor-in-Chief
