## Fruit Tree Viruses and Viroids

### Message from the Guest Editors

Fruit trees constitute a very important part of agricultural economy worldwide. They are propagated vegetatively and they are also grafted on rootstocks. As a result, they are susceptible to many plant viruses with some of them causing severe diseases, crop losses and reducing the productive life of their fruit trees host plants. The movement of propagative material across the borders has facilitated the spread of fruit tree viruses and their insect vectors worldwide. The last few years the use of next generation sequencing (NGS) technology has increased the number of virus species detected and in some cases these viruses were identified as the causal agents of known diseases having previously unknown etiology. The NGS technology has also increased the number of virus sequences deposited in the data bases and this also helped to improve their molecular diagnostic tools and studies on their genetic diversity. In this Special Issue of *Viruses*, we would like to include both research and review papers, providing an insight into the latest research on Fruit Tree Viruses and Viroids and to highlight key outcomes.

## About the Journal

### Message from the Editor-in-Chief

*Viruses* (ISSN 1999-4915) is an open access journal which provides an advanced forum for studies of viruses. It publishes reviews, regular research papers, communications, conference reports and short notes. Our aim is to encourage scientists to publish their experimental and theoretical results in as much detail as possible. There is no restriction on the length of the papers. The full experimental details must be provided so that the results can be reproduced. We also encourage the publication of timely reviews and commentaries on topics of interest to the virology community and feature highlights from the virology literature in the 'News and Views' section.

Electronic files or software regarding the full details of the calculation and experimental procedure, if unable to be published in a normal way, can be deposited as supplementary material.

### Author Benefits

#### High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, Embase, PubAg, AGRIS, and other databases.

#### Journal Rank:

JCR - Q2 (Virology) / CiteScore - Q1 (Infectious Diseases)

#### Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16.1 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2024).
