Use of Aquatic Biota to Detect Ecological Changes in Freshwater: Current Status and Future Directions

Message from the Guest Editors

Debuting one century ago, aquatic biota has been increasingly used worldwide to monitor and assess ecological changes as a result of environmental stressors. A large number of types of biological indicators have arisen to express changes in the structure (patterns) and function (processes) of freshwater ecosystems, such as benthic invertebrates, macroscopic plants, fish, phytoplankton and phytobenthos. Recent advances in molecular techniques, such as environmental DNA, remain however a promising tool to complement and replace traditional morphological identifications. Following the experience gathered in the last quarter of a century, new issues have come to the surface, including the level of determinism of cause–effect links, the capacity of bioindicators to integrate multiscaled complex pressures, and the variability of responses of biota under different restoration scenarios and land use changes. This Special Issue invites fundamental and applied research which follows on from recent developments in the biomonitoring of freshwater ecosystems to detect environmental stressors and point out future directions.

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.

Editor-in-Chief

Dr. Jean-Luc PROBST

Centre de Recherche sur la Biodiversité l'Environnement (CRBE) UMR CNRS/UPS/INPT/IRD, Centre National de la Recherche Scientifique (CNRS), University of Toulouse, Campus ENSAT, Auzeville Tolosane, Toulouse, France

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), Ei Compendex, GEOBASE, GeoRef, PubAg, AGRIS, CAPlus / SciFinder, Inspec, and other databases.

Journal Rank:

JCR - Q2 (Water Resources) / CiteScore - Q1 (Water Science and Technology)
